

1. What exactly is []?

The empty list value, which is a list value that contains no items. This is similar to how "" is the empty string value.

2. In a list of values stored in a variable called spam, how would you assign the value 'hello' as the third value? (Assume [2, 4, 6, 8, 10] are in spam.)

```
Jupyter Untitled Last Checkpoint: Last Thursday at 9:37 PM (unsaved changes)
File Edit View Insert Cell Kernel Widgets Help
[Icons] Run Code
In [1]: 1 spam = [2, 4, 6, 8, 10]
In [2]: 1 spam[2] = 'hello'
In [3]: 1 spam
Out[3]: [2, 4, 'hello', 8, 10]
```

Let's pretend the spam includes the list ['a', 'b', 'c', 'd'] for the next three queries.

3. What is the value of spam[int(int('3' * 2) / 11)]?

```
File Edit View Insert Cell Kernel Widgets Help
[Icons] Run Code
insert cell below
In [1]: 1 spam = ['a', 'b', 'c', 'd']
In [2]: 1 spam[int(int('3' * 2) / 11)]
Out[2]: 'd'
```

4. What is the value of spam[-1]?

```
Out[2]: 'd'
In [3]: 1 spam[-1]
Out[3]: 'd'
```

5. What is the value of spam[:2]?

```
In [4]: 1 spam[:2]
Out[4]: ['a', 'b']
```

Let's pretend bacon has the list [3.14, 'cat', 11, 'cat', True] for the next three questions.

6. What is the value of bacon.index('cat')?

```
In [1]: 1 bacon = [3.14, 'cat', 11, 'cat', True]
In [2]: 1 bacon.index('cat')
Out[2]: 1
```

7. How does bacon.append(99) change the look of the list value in bacon?

```
In [7]: 1 bacon.append(99)
In [8]: 1 bacon
Out[8]: [3.14, 11, 'cat', True, 99, 99]
```

8. How does bacon.remove('cat') change the look of the list in bacon?

```
In [5]: 1 bacon.remove('cat')
In [6]: 1 bacon
Out[6]: [3.14, 11, 'cat', True, 99]
```

9. What are the list concatenation and list replication operators?

The operator for list concatenation is +, while the operator for replication is *

10. What is difference between the list methods append() and insert()?

While append() will add values only to the end of a list, insert() can add them anywhere in the list.

11. What are the two methods for removing items from a list?

The `pop()` and the `remove()` are two ways to remove values from a list.

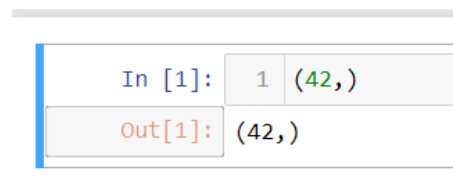

12. Describe how list values and string values are identical.

Both lists and strings can be passed to `len()`, have indexes and slices, be used in for loops, be concatenated or replicated, and be used with the `in` and `not in` operators.

13. What's the difference between tuples and lists?

Lists are mutable; they can have values added, removed, or changed. Tuples are immutable; they cannot be changed at all. Also, tuples are written using parentheses `()`, while lists use the square brackets `[]`.

14. How do you type a tuple value that only contains the integer 42?

A screenshot of a Jupyter Notebook cell. The input prompt 'In [1]:' is followed by the code '1 (42,)'. The output prompt 'Out[1]:' is followed by the result '(42,)'. The number '42' in the code is highlighted in green.

```
In [1]: 1 (42,)
Out[1]: (42,)
```

15. How do you get a list value's tuple form? How do you get a tuple value's list form?

Using the `tuple()` and `list()` function , respectively

16. Variables that "contain" list values are not necessarily lists themselves. Instead, what do they contain?

They contain references to list values.

17. How do you distinguish between `copy.copy()` and `copy.deepcopy()`?

The `copy.copy()` function will do a shallow copy of a list, while the `copy.deepcopy()` function will do a deep copy of a list. That is, only `copy.deepcopy()` will duplicate any lists inside the list.
